Ethnographic chats: a ‘best of both’ method for ethnography

Abstract

Conventionally, ethnographic methods aim to discover how language works as ‘situated social practice and how it is tied to social organisation’ (Heller 2011: 10). Within this, ethnography has viewed participant observation as central and essential. More recently ethnographers have moved to combine this with more structured, researcher-facilitated question-based tools such as ethnographic interviews (Spradley 1979) and focus groups. This article reports on a creative method, aiming to bring together the strengths of both these approaches to access school-age young people’s orientations to language education policies. There were three main motivations: firstly to minimise the distracting influence of the researcher’s presence; and to aid in empowering participants, encouraging them into an active role in the research process; and to avoid favorability bias in participant responses. On the latter point, to truly value the voice of participants you have to find creative ways to move beyond the ‘right answer’. This often requires pushing methodological boundaries in new or creative ways. Building on prior approaches I developed a new protocol, ‘ethnographic chats’, which I found offered the ‘best of both’: a compromise between the immersive depth of participant observation and the greater thematic focus of focus groups or ethnographic interviews. The method was characterised by specific procedural and interactional characteristics of frame and genre, which differentiate it from ethnographic interview and focus group methods in specific ways. Rich data emerged from this process, which would not otherwise have been available. I conclude by outlining the potential for ethnographic chats in other social and geographical contexts.

Ethnography – the tradition

Hammersley (2006) suggests that like many other methodological terms in the social sciences, ‘ethnography’ does not form ‘part of a clear and systematic taxonomy’ (2006: 3). It is used in different ways and to describe various related approaches. Nevertheless, these different ethnographic approaches share many common features. Principally, ethnography refers to a form of social and educational research that is committed to ‘the first-hand experience and exploration of a particular social or cultural setting’ (Atkinson et al: 2007: 4). The nature of ethnographic research means that ‘no homogeneous units or specific characteristics of culture are defined a priori, but rather those groups and processes recognised by native participants are discovered and studied in their terms during the research’ (Gregory 1983: 366). Malinowski talks of ‘foreshadowed problems’ (1922: 8-9), rather than fixed research questions, and his anthropological linguistic research was foundational for ethnography.

Instead of going into the field with fixed ideas, ethnography is concerned with producing descriptions and explanations of particular phenomena, with the process and inquiry becoming progressively more focussed. More than any other research method, ethnography requires the researcher to follow themes wherever they lead; it is a generative process, requiring flexible adaptation.
The term ethnography refers primarily to a ‘particular method or set of methods’ (Hammersley and Atkinson 1993: 1). In its most characteristic form, ethnography involves the researcher participating, overtly or covertly, in people’s daily lives, watching what happens, listening to what is said, asking questions (through informal or formal interviews), and collecting whatever data is available to shed light on the issues that are the focus of the research. In other words, ethnography, as a method of social research, seeks to capture and understand the meanings and dynamics in particular cultural settings using a range of systematic data-collection techniques to record what goes on.

**Focused discussions**

Whilst the mainstay of ethnography is participant observation (Hymes 1962), ethnographers often combine this with more structured question-based ethnographic methods. These can conventionally range from an opportunistic conversation, where questions arise on the spur of the moment and where accounts of these passing and fleeting conversations are captured in field notes (see Roberts et al 2001 for a discussion of ethnographic conversations), to in-depth, one-to-one interviews (see Spradley 1979 for a discussion of ethnographic interviews) that are formally arranged, recorded and transcribed. O’Reilly (2012: 136-138) also talks of ‘group interviews’ arguing that they are akin to focus groups in allowing for multiple views to be garnered.

Focus groups share many common features with less structured interviews but still revolve around a discussion being guided, monitored and recorded by a researcher. They also still sit some way apart from the more immersive experience of participant observation. In my research I sought to bring these two elements together. My research aimed to assess students’ orientations to the consequences of language education policies. In this context, the traditional format of initiation/response sequences was felt to be inconsistent with the ethnographic priority that ‘no homogenous units or specific characteristics of culture are defined a priori’ but rather ‘those groups and processes recognised by native participants are discovered and studied in their terms during the research’ (Gregory 1983: 366).

Additionally, in action-based research, such as the work discussed here, the aim is often to empower research participants, to give them a voice and to allow them to become an active part of the research process. In order to fully realise this aim, researchers often need to work in new or creative ways in order to push methodological boundaries. In light of this, I built on existing methods to develop a refined ethnographic protocol.

**The ethnographic chat**

My research began as a conventional ethnography. My sites spanned two schools and a youth club. I observed activities both inside and outside the classroom. My observations were recorded in 27 sets of field notes representing approximately 110 hours of fieldwork (in all three sites). An analysis of my initial field notes was undertaken in order to formulate research questions. Participant observation was working well, but when it came to complementing this with something more targeted, conventional researcher-facilitated tools like focus groups seemed ill-suited to capturing rich ethnographic insights. Furthermore, as
noted above, I sought to empower my participants, to encourage active participation in the research. This similarly required some innovation.

Meanwhile, working as a non-Welsh speaking researcher in a bilingual (Welsh and English) community raised other practical concerns. I wanted to ensure that I was able to offer the participants a choice as to which language(s) to use during the research process but would have been unable to do this with a researcher-facilitated approach such as an interview or a focus group. The development of the ethnographic chat helped with this as well.

Open-ended prompts were written to be used as the basis for the ethnographic chats, a sample of which is shown below, in Figure 1.

![Figure 1 - Sample of prompts](https://example.com/figure1.png)

The prompts were written in both Welsh and English. Participants were given the choice as to which language(s) to use, and it was explicitly stated that they could use both. Prompts were pragmatically realised as open-ended ‘topics’ rather than specific questions. The open-ended nature of the prompts allowed and encouraged students to have open and apparently frank conversations. That chat data, was not therefore treated as a potential proxy for direct observation. Whilst the students generally proved to have a shared understanding of everyday experiences, some disagreement did emerge. A multiplicity of views was garnered but with consensual stances predominating. Beyond simply being present, I had limited involvement in these chats, which proved crucial (discussed further below)

But these ‘chats’ were not simply thrust at these young people out of nowhere. In the tradition of ethnography, I had previously spent several months living and working in the community, carrying out participant observations. Approximately forty visits of varying length were made to the community in question; and my time at the schools was spent observing, where possible, classrooms, assemblies, break times, lunchtimes, school shows, sporting fixtures, and parents’ evenings. I also observed and participated in community events such as local fêtes and cultural festivals.

On the basis of initial observations (as recorded in field notes), approximately twenty students were chosen as principal participants (key informants) in each school. It is beyond the scope of this report to discuss, in any detail, the process by which principal participants
were chosen, but it is important to acknowledge that selecting key informants should not be thought of as a sampling procedure based on empiricist principles of representativeness. That said, careful consideration was given to ensure, where practically possible, that a broad spectrum of experiences were reflected in the research, and in light of this a range of language abilities, language preferences, medium of instruction, ages, and genders were taken into consideration. Key informants were chosen on the basis of initial observations within the community under investigation.

It was these key participants who went on to be involved in the ethnographic chats. Consequently, I was well known to these students and had built good working relationships with them.

A groups of 4-5 students - all key informants and part of an established friendship group - were asked to take part in the ethnographic chats. The format of the sessions was consistent throughout. Participants scheduled the chats themselves, at a mutually convenient time and location. This made for a relaxed, informal environment with students partaking in seemingly unrelated activities such as eating their lunch and listening to music. Allowing participants to do ‘other’ things whilst discussing a series of prompts allowed for the kind of blending of approaches identified earlier, namely informal participation and more formal interviewing. My own presence was often scarcely noticed. And these ‘other’ activities often became relevant to the emerging data, for example they led me to previously unknown students, teachers, places and activities; they allowed me to see the school context through the eyes of the students themselves more thoroughly than if I had been more explicitly involved in the discussion.

Whilst the majority of the ethnographic chats were held during break and lunchtimes within the school day, some occurred after school at a student’s home or in another community space, such as a library or youth club. This flexibility was built into the research design not only to encourage a sense of ownership and control amongst my participants, but also to limit the impact of the research process on students’ day-to-day lives.

Once the participants had agreed a time and location for the ethnographic chat, I would briefly meet them to give them the prompts. Students would be asked to elect a member of the group to lead the chat (by reading the prompts). Whilst students were encouraged to talk freely, the ‘lead’ student was asked to occasionally bring the group back to the prompts. In practice, the discussion that led on from each prompt would at some point naturally wane and the ‘lead’ participant would read the next prompt.

The chats were recorded using a voice recording app on a mobile phone (normally belonging to one of the participants) in order to minimise conspicuousness, and maximise flexibility in terms of location and timing. The recorded chat was then sent over to me and permanently deleted from the participant’s phone. On reflection, this could have had some risks in terms of data security. Using my own phone, or other recording device, may have given greater data security, and lessened the risk of accidental leaks contravening their consent.

As I have discussed, ethnography conventionally meshes observational data with more focussed, question-based methods. What then is distinctive about ethnographic chats? Ethnographic chats were developed by drawing on established methods such as the
ethnographic interview (Spradley 1979), semi-structured interviews and focus groups, all of
which are traditionally researcher-facilitated. The chats employed here were characterised by
specific procedural and interactional characteristics of frame and genre, which differentiated
them from both the ethnographic interview and the focus group. These differences will be
outlined below.

*Researcher involvement*

In designing ethnographic chats I sought to unite the best of informal participation and formal
recordings - in other words to blur the boundary between the two. The first point of departure
from a more traditional researcher-facilitated approach was the level of involvement from the
researcher. Once prompts had been given to the students I had little or no involvement,
choosing instead to either leave the room, read a book, or to do some work. If I remained in
the room, I only became involved if students themselves addressed me directly. Therefore,
follow-up questions were initiated by the students themselves and in this sense the
ethnographic chats resembled a conversation in that students were free to bring in new topics,
and to signal a change of topic (see extract below for an indication of how this worked in
practice).

**Extract 1, English school, sixth-form**

C: Ok (.) so shall we talk about what we think our school
thinks about language
D: you can speak whatever you want
C: yeah
D: sometimes you can speak to a teacher and you won’t
understand (.)can say that I don’t know what you mean (.) but:
they won’t
C: they won’t tell you off
D: won’t tell you off or anything
R: So I guess (.) would we say then that they (.) the teachers
are quite laid back? (.) very laid back
D: yeah (.)just because it’s a bilingual school they have to
promote both languages
A: yeah it’s up to you (.) but I don’t know how much they
actually want to promote Welsh or whether they have to (.) I
don’t know whether there’s some sort of financial gain or
something?
R: What do you mean?
A: Well like (.) if they had a real choice would they just do
everything in English(,)which is obviously the most important
language in the world (.) it sometimes feels that they are
doing the whole Welsh thing to please someone else
R: I’m not sure I agree
C: loads of the teachers here are first language Welsh
speakers so of course they feel it's important (.) some of
them are really passionate about the subject and the language
So whilst I was able to maintain a focus consistent with my research themes through the use of prompts (Lines 1-2 of the above extract), their loose structure (consistent with ethnographic principles) allowed discussions to flow and develop. Two follow up questions were posed by students (Lines 9-10 and Line 16). Participants were free to explore the topic in whatever depth they chose, without checking or clarifying from me. Additionally, as seen in the above example, participants were able to build alignments and dissociations with each other relative to the topic of the prompt. Overall, the chats resembled both the purposeful questions of ethnographic interviews and the emergent questions of a conversation. Meanwhile the greater distance between myself, as the researcher, and the participants gave them more autonomy and freedom to speak, and de-emphasised my role as an orchestrator of issues.

**Extract 2 - Year 10, Welsh School**

M: Ok so let’s talk about what our school thinks about language (1.0) well Ysgol Arnant is a Welsh school and if you speak English they’ll (.) the teachers (.) be like “speak Welsh” (.) “siarad Cymreig” (‘speak Welsh’) H: yeah we’re not supposed to speak English at all (.) we speak more Welsh than English F: “speak Welsh” H: yeah but we can speak it outside of class (.) well I do M: but why do you? Is it just to piss the teachers off? H: I guess (.) but like I’ll do what I want in my own time (.) none of their bloody business F: but that’s why you’re always in trouble with the Gogs (.)(laughter) H: well the goggy teachers should just fuck off and realise that there’s more important things in life (.) people in the world are starving and they’re worrying about a little old language M: bit harsh innit? H: yeah probably (.) I’m just a bit sensitive at the moment because I feel like I’m always in trouble

The above extract illustrates that the prompts allowed for an analysis of reported language practices and the discursive understanding of these practices, while allowing for a degree of naturally occurring speech. This in turn enabled analysis of ‘ideologies in action’ (Jaffe 1999) – what young people actually do, conversationally, in ways that sometimes allowed ideological values to leak through. In the above extract we see quite clearly that the girls begin by articulating the more official school policy (Lines 1-6). They identify that the school constructs and implements linguistic norms - understood as part of the school’s political and nationalist mission, embedded within a minority struggle for power. The group dynamics allowed for a snowballing effect, with one observation initiating a chain of additional comments. From line 8, the topic shifts slightly and we see discussion turn to why one student (Harri) fails to conform to the school’s expectations with regards to language use and language choice. Here we see the girls’ ideological values coming to the fore. The ethnographic chats allowed young people to express themselves using their own informal shorthand and in-jokes, and speak without concern about my comprehension.

Based on my earlier in-depth ethnographic observations, I felt assured these insights would
not have arisen with more explicit involvement from me in the discussion; but nor would I have gained these insights from entirely undirected observation alone. Ethnographic chats provided the best of both.

Conclusions

An ethnographic chat may be a different, and in some contexts, better way to combine participant observation with more structured recordings. They allow for an element of structure without compromising participants’ freedom to elaborate on topics of interest to them.

I feel there is clear potential for the use of ethnographic chats in other contexts. O’Rouke’s (2011) research with Irish undergraduate students, for example, used focus groups in order to access ‘collective discourse practices with a high degree of spontaneity’ (2011: 332). Rich insights certainly emerge from this; however, the discussions were facilitated by an Irish language tutor from the University who had previously taught many of the participants. Did students feel they could talk openly, without judgment, given the presence of their tutor? Or was there an element of favourability bias? O’Rouke (2011:333) also notes that these focus group discussions were conducted in Irish. Again, participants may have felt some constraint on their choice of language (or indeed the choice to code-switch) given the presence of their Irish language tutor. It is impossible to say; but that is precisely my point. Developing the ethnographic chat enabled me to find new spaces to experiment in, to allow new insights to arise; and I think the same approach could allow other researchers similar new insights.

To reprise my overarching theme, ethnographic chats offered me the best of both worlds, and I think they could do the same for others. They combine the strengths of other qualitative methods: the open and enquiring questions of an ethnographic interview, the overlapping contributions of a focus groups, but crucially without the potentially diluting or distracting influence of the researcher. An added benefit is in enabling researchers without competency in the community languages to work alone without an interpreter, while offering genuine linguistic choice to research participants.

Lastly, ethnographic chats empowered my participants to decide where to take the research - they were able to introduce new topics, and indeed new participants. I was ultimately able to hold on to the research aims and expectations through the use of prompts; but they had a form of ownership not otherwise available.

Let me close by re-emphasising that ethnographic chats do not work on their own. Whilst many of my key analytic insights come from this source, they were underpinned by a much longer process of participant observation and careful collation of field notes. These more traditional ethnographic tools underpinned it all. Ethnographic chat data couldn’t act as a proxy for direct observation, nor could they be reliably designed without first having such a detailed understanding of the community. Ethnographic chats usefully complement, but also rely on, the established tools of the ethnographic tradition.
