5 **people with dementia to connect during the pandemic and beyond**  
6  
7

8  
9 **Abstract**  
10

11  
12 **Purpose** - Community Makers (<https://communitymakers.co>) is an active UK wide  
13 network that evolved rapidly in response to COVID and the negative impact of social  
14 isolation and distancing on people and families affected by dementia. The network is  
15 led by the XXXXXX, XXXXXX and XXXXXX. The aim was to investigate what works  
16 for whom and why and in what circumstances as a basis for the development of an  
17 online toolkit for people supporting people affected by dementia to connect and  
18 reconnect during the pandemic and beyond.  
19  
20  
21  
22  
23  
24  
25  
26  
27

28 **Design/methodology/approach** - The development of the toolkit was informed by  
29 an iterative approach of engagement with people affected by dementia, learning from  
30 a network of community organisations and a rapid realist literature review.  
31  
32  
33  
34

35 **Findings** - Four common factors which combine to make a successful support  
36 intervention, regardless of its type, size or location were identified:- relationships;  
37 purpose, technology and community. The application of the factors, adopted as  
38 principles, is illustrated by applying them to three real world examples.  
39  
40  
41  
42  
43

44 **Social implications** – The main output was the online tool kit which is a resource of  
45 creative ideas to inspire groups with different approaches to digital involvement and  
46 help reduce social isolation.  
47  
48  
49

50  
51 **Originality/value** – This report offers new insight, based on identification of four  
52 principles, into how people affected by dementia can be supported online and offline  
53 during a pandemic and beyond.  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 **Key words:** dementia, technology, social isolation, purpose, relationships,  
4  
5 community,  
6  
7

8 **Running title:** Community Makers: an online toolkit to support people affected by  
9  
10 dementia  
11  
12

### 13 14 15 16 **Introduction and context** 17

18  
19 According to the World Health Organization (2021) there are around 55 million  
20  
21 people who have dementia, with over 60% living in low- and middle-income  
22  
23 countries. As the proportion of older people in the population is increasing in nearly  
24  
25 every country, this number is expected to rise to 78 million in 2030 and 139 million in  
26  
27 2050,' In the UK there are currently around 900,000 people with dementia and this is  
28  
29 projected to rise to 1.6 million by 2040 (Alzheimer's Society, 2021).  
30  
31  
32

33  
34 Social isolation and loneliness are risk factors for dementia and increased loss of  
35  
36 social contact with friends, neighbours and family has only exacerbated the situation  
37  
38 (Curelaru et al., 2021). Initial COVID-19 restrictions had a particular negative impact  
39  
40 on the health and well-being of people affected by dementia and highlights the  
41  
42 urgent need for intervention (Alzheimer's Society, 2020). Further, restrictions have  
43  
44 enforced changes to routine, causing anxiety and strain in relationships; led to a  
45  
46 reduction in skills and confidence; and increased pressure on home carers, not least  
47  
48 through the erosion of support systems (Tuijt et al., 2021).  
49  
50  
51

52  
53 Due to the age profile and vulnerability of the majority of people affected by  
54  
55 dementia, the impacts of isolation due to the pandemic will likely be felt for longer  
56  
57 than the general population, as they remain vulnerable to infection and dependent on  
58  
59 the support of others (Manca, 2020). The pandemic has forced many of those  
60

1  
2  
3 involved in community-based support to explore the use of technology to support  
4 people affected by dementia and to address this core issue of social isolation  
5  
6  
7 (Evans, 2021).  
8  
9

### 10 *Background to Community Makers*

11  
12 Before the start of the pandemic, the XXXXXX worked together with XXXXXX, an  
13 XXXXXX to create the Minder programme (<https://mindermeetingplace.com/>). This  
14 programme aims to develop technology to support people living with dementia in  
15 their homes to allow them to live more independently for longer. A human-centred  
16 design process is used for Minder to ensure that the technology created is suitable  
17 for use in the homes of people living with dementia. This was initially performed  
18 through regular face-to-face meetings and home visits to discuss the technology with  
19 the study participants. However, this was no longer possible once the pandemic  
20 began. Instead, these meetings were moved online. In addition to discussing the  
21 Minder technologies and study design, it became clear that the participants  
22 benefitted from the social aspects of these meetings.  
23  
24

32  
33  
34  
35  
36  
37  
38  
39  
40

41 As a result of the regular Minder meetings, the idea of a virtual community centre  
42 developed. To take this idea further, the XXXXXX approached the XXXXXX and a  
43 small team was established in April 2020 to create the Community Makers project  
44 ([www.communitymakers.co.uk](http://www.communitymakers.co.uk)). XXXXXX joined the team in May 2020 as there was  
45 considerable synergy between its work with Meeting Centres for people affected by  
46 dementia in supporting people affected by dementia at the start of the pandemic  
47 (Evans, 2021).  
48  
49  
50  
51  
52  
53  
54  
55  
56

57 The team worked together and drew upon their respective expertise to carry out the  
58 various aspects of the project. These included identifying the requirements of people  
59  
60

1  
2  
3 living with dementia and how this evolved over the pandemic; designing the website;  
4  
5 connecting and communicating with community groups across the UK; and  
6  
7  
8 coordinating the monthly newsletters and meetings with organisers of the community  
9  
10 groups.

11  
12  
13 Whilst the original impetus was to set up a central virtual community centre it soon  
14  
15 became evident that there was a significant number of online support initiatives for  
16  
17 people affected by dementia across the UK. It appeared that what was needed was  
18  
19 a support network and resource for those already involved with online communities  
20  
21 or thinking of moving support online.  
22  
23

24  
25 Another aspect that needed consideration at an early stage was digital exclusion and  
26  
27 barriers to online connectivity. Community Makers was originally largely about  
28  
29 leveraging the opportunities that an online environment can offer people in terms of  
30  
31 making and maintaining social connections. However, it was recognised early on in  
32  
33 the project that many people do not have the technology and/or the digital skills  
34  
35 needed to get connected. This can be affected by barriers to those with physical  
36  
37 difficulties and for some this might be age-related, barriers relating to the individual  
38  
39 such as education and gender and barriers related to the technology itself (Yazdani-  
40  
41 Darki et al., 2020). This complex landscape can be challenging for anyone but there  
42  
43 is a range of additional barriers for some people with dementia which include  
44  
45 memory, language, communication, attention span, sequencing, problem solving,  
46  
47 and comprehension. This means that there will be a significant number of people  
48  
49 affected by dementia who will not be able to access online support and therefore it  
50  
51 was important to consider non-digital solutions.  
52  
53  
54  
55  
56

57  
58 *Project aims*  
59  
60

1  
2  
3 The aim of the project was to identify which resources to include in the toolkit to  
4 inform groups supporting people with dementia with technology and how to reach  
5 people without technology and skills. Due to the rapid onset of the pandemic and the  
6 need to keep people connected time was of the essence.  
7  
8  
9  
10  
11  
12

## 13 14 **Methods**

15  
16  
17 Three approaches involving an iterative process were taken to inform development  
18 of the resources. These were feedback from online workshops with people affected  
19 by dementia, learning from the network of community organisations that evolved and  
20 a Rapid Realist Review (RRR) of the literature,  
21  
22  
23  
24  
25

### 26 27 *Online workshops and network meetings*

28  
29 Two explorative workshops with fifteen people with dementia and ten carers from the  
30 Alzheimer's Society's Dementia Voice National Groups  
31 (<https://alzheimers.org.uk/get-involved/dementia-voice>) were held. These focused  
32 on people with dementia and carers' experiences of accessing support and activities  
33 during COVID-19 lockdown and what dementia support and activities they would like  
34 to see when lockdown ended. In addition, a range of webinars was held with different  
35 groups supporting people affected by dementia presenting on their how they  
36 addressed this. The webinars were accompanied by discussion and questions and  
37 written up as blogs and insights on the Community Makers website.  
38

45  
46  
47  
48  
49  
50

### 51 52 *Rapid Realist Review*

53  
54 Realist reviews are an approach to synthesising evidence first promoted by Pawson  
55 (2002). A Rapid Realist approach (Saul et al., 2013) to the literature review was  
56 deemed appropriate as such an approach aims to ensure findings are generated and  
57  
58  
59  
60

1  
2  
3 disseminated in response to the urgent nature of the situation (Maidment et al.,  
4  
5 2021). Whilst the intention was not to inform policy, the urgency of the situation and  
6  
7 the application to developing a resource was a good fit.  
8  
9

10 The purpose of the Rapid Realist Review (RRR) was to create a preliminary  
11  
12 theoretical model (programme theory) exploring how different contexts  
13  
14 (circumstantial factors) can trigger mechanisms (processes and responses in people  
15  
16 and organisations) to produce desirable or undesirable outcomes (i.e. meeting their  
17  
18 needs or not meeting their needs).  
19  
20  
21

22  
23 The RRR did not include a stakeholder/expert panel consultation to design the RRR  
24  
25 and validate its results but it has been supplemented by stakeholder consultation.  
26  
27

28 This RRR was conducted in a much shorter timescale (less than one month) than is  
29  
30 usual even for the already expediated RRR process (usually 3 to 6 months) and has  
31  
32 been conducted in the main by a single researcher with expertise in realist  
33  
34 approaches, under direction from the wider Realist Evaluation team, rather than  
35  
36 having a dedicated team for the RRR itself. Hence this is less a full review and more  
37  
38 an application of a realist logic of analysis to selected literature in the area. However,  
39  
40 as stated by Saul et al. (2013): “The RRR methodology allows for the ability to scale  
41  
42 the project based on the time and resources available.”  
43  
44  
45

46  
47 *Sources included were:*  
48

- 49 • Extant literature on the use of technology by people affected by dementia.
- 50
- 51 • Relevant recommended articles.
- 52
- 53 • Recent articles regarding the topic area gathered in scoping searches of
- 54
- 55 relevant databases.
- 56
- 57
- 58
- 59
- 60

*Search strategy:*

1

38 *Ethical considerations*  
39

40 The workshops were held with members of the Alzheimer's Society's Dementia  
41 Voice National Groups (<https://alzheimers.org.uk/get-involved/dementia-voice>). The  
42 purpose of the Dementia Voice groups is to help share experiences, insights and  
43 ideas to help improve services and products. Participants had therefore already  
44 provided consent in terms of participation. Any information was anonymised and no  
45 quotes were used.

57 **Results**  
58  
59  
60

### *Online workshops for people with dementia and carers*

Key aspects relating to development of the toolkit that were identified by people with dementia and family carers were:

#### **1. A blended offer of online and face to face support and activities**

There is a need to reach those who are digitally excluded and in usual times it is likely that most people will benefit from a blended approach to support.

#### **2. Consistent support with getting online**

Carers and people with dementia reported varying levels of confidence and skills in terms of getting online and connecting with others in a meaningful way during lockdown. Those who reported being fairly confident using online tools noted that taking part in online groups and activities helped them to stay connected with support services, friends, family and their wider community. For others, a lack of consistent dementia-friendly support and technology to enable them to take part in online activities led to increased feelings of frustration and isolation.

#### **3. Reaching the most isolated carers and people with dementia**

It was felt important to work hard to reach the community of people who do not naturally attend groups and flagged the importance of identifying and reaching out to hidden carers.

#### **4. Working with carers and people with dementia**

Attendees said that the team should work with people with dementia, carers and community leads to ensure that any hybrid model of support or materials truly meets their needs and is acceptable to them.

### *Learning from the network*

Learning was captured via Insights (<https://communitymakers.co/insight-collection/>) and a blog (<https://communitymakers.co/news/>). Key barriers to connecting people with dementia in the community during lockdown which were identified included lack of:-

- Access to technology and the internet.
- Confidence in using certain technologies or the internet once people have access to it.
- Guidance and support.
- Purpose to get connected: people with dementia need a clear reason to overcome intrinsic and extrinsic barriers to getting online and getting involved in support, creative and social activities.

Strategies used by community groups for helping people to get or stay connected included:-

- Enabling access to the right technology alongside information on how to use it.
- Training and 1-1 support: to help people get online and make the most of what is available.
- Enabling people to try out new software in a safe environment

- Establishing relationships, for example by having a named contact to support carers and people living with dementia with using the technology.
- Taking a strengths-based approach drawing on local connections and community groups who know the local landscape and have relationships with people in the area.
- Focusing on the most excluded people in the community including both people with dementia and carers.

### *Rapid Realist Review*

The literature search returned 139 articles of which 27 were held to be relevant. This included following up references from the systematic reviews as it appeared that the more relevant articles were pre-2016 indicating that there has been limited research in the area during the last five years (although there has been an increase since the pandemic).

A Realist logic of analysis involves seeking to identify and trace incidences in the data where context can be said to be triggering mechanisms that produce certain outcomes. Contexts are a set of circumstances that may set in motion a response, action or process (mechanism) in a person, group of people or organisation, that then produces a desirable or undesirable outcome.

In the literature reviewed, some of the ways in which contexts were said to trigger mechanisms to produce certain outcomes are outlined and grouped together as themes as follows in Table 1.

---Insert Table 1 here---

## Discussion

From the online workshops and RRR there appeared to be four common factors which combine to make a successful support intervention, regardless of its type, size or location and these are relationships, purpose, technology and community.

### *Relationships*

Establishing trust between a user and supporter is essential to persuade people to engage in new digital products and services. This might be through a formalised outreach programme or informally through friends and neighbours. This is particularly important within minority communities built around a shared culture. Often, these relationships will begin offline. This principle came through strongly in the online workshops conducted, though was less explored in the literature found via the RRR. The RRR did identify the importance of following up with people who have technology but have failed to make use of it, for example, and that people can find the use of technology in a group setting easier, as any difficulties encountered will not seem so abnormal or insurmountable.

### *Purpose*

People who are not familiar with, or afraid of, technology need a strong and clear reason to overcome their perceived barriers. Not everyone will want to join a singing group, for instance. This purpose is personal and unique to the individual. There is a role here for drawing on trusted relationships to establish what motivates each person.

The RRR identified that people living with dementia need to see a clear purpose for technology and have motivation to make use of it. This is more likely to happen when

1  
2  
3 the design and promotion of the technology takes good account of their needs,  
4 preferences, ability, activities and circumstances.  
5  
6

### 7 8 *Technology* 9

10 Technology needs to suit the individual in terms of flexibility, usability and alignment  
11 with their purpose. This should be considered for both hardware and software.  
12

13 Simply giving someone a device may not be enough, they need to be supported to  
14 use it physically and functionally. For example, we heard of a service user who had  
15 bad arthritis and could not operate the tablet until they were given a stylus to use  
16 with the touchscreen.  
17  
18  
19  
20  
21  
22  
23  
24  
25

26 The RRR identified the importance of better research to develop technology and  
27 avoid replicating ineffective tools, involving people living with dementia in the whole  
28 development process. Such involvement not only helps technology to be usable and  
29 appropriate but can also help generate enthusiasm and a desire to use it.  
30  
31  
32  
33  
34  
35

36 Technology should enable people to feel more in control rather than less and is most  
37 attractive if it is (better designed) everyday technology that is part of “normal life”  
38 rather than dementia-specific, as this is less stigmatising. Those seeking to support  
39 people to use technology also need good knowledge of the range of options out  
40 there to ensure they select the most appropriate technology available.  
41  
42  
43  
44  
45  
46  
47  
48

### 49 *Community* 50

51 Once the technology is in place, and the person has been motivated and enabled to  
52 use it they can start to connect with others, helping them to feel less socially isolated  
53 and part of a community. This might involve re-connecting with people they fell out of  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 touch with or joining entirely new groups. This sense of belonging motivates them to  
4 stay engaged, fostering new relationships, and deepening existing ones.  
5

6  
7 It is important to remember that as people try technology and gain new experiences,  
8 their perception of the opportunity will develop. For example, they may feel that they  
9 could not cope with a group chat, only to find that they love listening to the  
10 conversation. Alternatively, a digital connection may open up a new hobby or interest  
11 shared with an old friend in another part of the world. The RRR identified that  
12 technology has strong potential to increase social connectivity, engagement and  
13 participation for those who might otherwise find this a challenge.  
14  
15

16  
17 Whilst the principles are considered separately above it is important to note that the  
18 four aspects are interrelated. For example, if someone is to be supported adequately  
19 to use the technology then there needs to be a trusting relationship with clear  
20 knowledge of individual needs, what technology is available to best suit the person  
21 and the task as well as what the benefit might be for that person. Only then can  
22 social inclusion and connectivity be optimised. Figure 1 illustrates the  
23 interrelationship between the four key principles.  
24  
25

26  
27 ---Insert Figure 1 here---

### 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 *Applying the principles*

54  
55 As indicated above, a range of real life examples of online support informed the  
56 development of the resources and network and future work. The examples covered a  
57 range of locations and demographics. Three examples, featured on the Community  
58  
59  
60

Makers website, of how the principles can be applied to existing initiatives supporting people with dementia are set out below.

**Chinese Wellbeing** (<https://communitymakers.co/cuture-and-belonging/>) is based in Liverpool and established in 1989. It primarily focusses on the Chinese community, but also works with other ethnic and immigrant groups. As well as providing care services, a large part of their work includes raising awareness and reducing the stigma of mental health issues and disabilities within this community. Language is a particular barrier and this can be exacerbated by the use of technology.

**Relationships** - as part of engaging someone Chinese Well-being researches peoples' interest in food, music and important relationships to make the process personal and meaningful to the individual.

**Purpose** – illustrated by an example of a participant who overcame a deep fear of technology to become an enthusiastic participant in art-based sessions and is always first to arrive for each online session.

**Technology** – use of a Chinese app WeChat, and creation of bespoke 'spot the difference' games to teach members how to use Zoom.

**Community** - adapted Dementia Care concept to "Tea House Reminiscence sessions" using memorabilia collected on trips to China and aimed at drawing on strengths in long term memory.

**Dementia Adventure** (<https://communitymakers.co/nurture-and-nature/>) aims to enable people living with dementia to get outdoors, connect with nature, themselves

1  
2  
3 and their community, and keep a sense of adventure in their lives taking into  
4  
5 consideration whatever 'adventure' may mean to the individual.  
6  
7

8 **Relationships** - Dementia Adventure works with families and couples  
9  
10 together to create bespoke engagements that suit the individual. They  
11  
12 translated this approach from face-to-face to digital supported engagements  
13  
14 during the initial lockdown.  
15  
16

17 **Purpose** – developed digital engagements around the theme of connecting  
18  
19 with nature, bring nature in from the garden, to help people reintegrate with  
20  
21 going outdoors.  
22  
23

24 **Technology** - developed free-to-access, digitally delivered training materials  
25  
26 to teach people how to make the most of nature and the outdoors to support  
27  
28 people with dementia  
29  
30

31 **Community** – adapted their approaches for example motivated and  
32  
33 supported people remotely to go out their front door within their family support  
34  
35 bubbles. There is a need to overcome people's low mood and fear of going  
36  
37 outside to help them get these valuable benefits. They developed fully funded,  
38  
39 free-to-access training available through their website to teach people how to  
40  
41 make the most of nature and the outdoors to support people with dementia  
42  
43  
44  
45

46 **Dementia Matters Here(fordshire)** ([https://communitymakers.co/insights/starting-  
47  
48 small/](https://communitymakers.co/insights/starting-small/)) during lockdown Dementia Matters Here(fordshire) set up  
49  
50 online Meeting Points for people affected by dementia and carers. These groups  
51  
52 were new and people had not met face-to-face before. The charity started with a  
53  
54 group for people with dementia and carers on a Wednesday afternoon and then  
55  
56 swiftly expanded with a carers' session on a Tuesday evening. New members were  
57  
58  
59  
60

1  
2  
3 able to join the online groups and once restrictions became more relaxed people  
4  
5 started to meet face-to-face.  
6  
7

8 **Relationships** – an online group started up which did not previously exist  
9  
10 building new relationships that continued with people meeting up face-to-face.  
11  
12

13 **Purpose** – the aim was to help people connect with other people who were  
14  
15 feeling isolated and who wanted support. Moving forward the online groups  
16  
17 would be a useful means of support in a rural county.  
18  
19

20 **Technology** – funding was obtained to provide tablets and data for people  
21  
22 who did not previously have it and provided support for people to get online  
23  
24 and join the weekly meetings  
25  
26

27 **Community** – the number of people attending sessions increased slowly but  
28  
29 surely over the first few months and people became more confident in using  
30  
31 the technology enabling them to focus on interacting with other people. During  
32  
33 the summer people attended less as they preferred to meet face-to-face but  
34  
35 attendance increased in the autumn.  
36  
37

## 38 39 **Conclusion**

40  
41  
42 The Community Makers project focused on enabling community-based support to be  
43  
44 as effective as possible through the creation of a toolkit. While groups have already  
45  
46 found new benefits to online communication, there is concern for those who remain  
47  
48 digitally excluded. By creating a network of knowledge and experience exchange  
49  
50 alongside the toolkit, we aim to increase the adaptiveness and resilience of  
51  
52 community groups, not least in supporting members to get online and communicate  
53  
54 with families and peers.  
55  
56  
57  
58  
59  
60

1  
2  
3 Whilst the Community Makers project originally started out as a virtual community  
4 centre, it became clear from networking events that organisations were eager to  
5 learn and share knowledge with each other. Therefore, rather than being one large  
6 virtual social group for people living with dementia and their carers, the project  
7 became the Community Makers Network to provide community groups with the  
8 advice and guidance they needed to setup their own virtual community groups. This  
9 approach built on existing trusted relationships in the community, which proved to  
10 very important for a demographic that was nervous about embracing new  
11 technologies. Furthermore, the resource can help upskill and empower existing  
12 groups which puts them in a better position to offer hybrid digital and face-to-face  
13 services as the pandemic restrictions ease.

14  
15 The learning from the workshops and the network supplemented the outcomes from  
16 the RRR to formulate four principles of online community support which in turn was  
17 used to inform the on-going development of the Community Makers toolkit.

18  
19 The four principles that evolved from the exploratory work provide a useful way to  
20 think about how digital technologies can be developed to fit the needs of the  
21 individual, rather than trying to fit the individual to the technology. Anyone developing  
22 a community, outreach programme, or even extending an arm to a neighbour should  
23 ensure they understand how all four principles apply to each individual in order to  
24 best support a person to make meaningful connections.

25  
26 As the state of the pandemic has changed and continues to do so, so has  
27 Community Makers. Once restrictions eased in the UK, opportunities arose for  
28 community groups to meet in-person, as well as online. To help with this, the  
29 Community Makers project provided support for groups to take a hybrid approach of

1  
2  
3 both virtual and physical meetings and to reach those who are digitally excluded.

4  
5 This is in line with Evans et al. (2021) who posit that digital upskilling people with  
6  
7 dementia, family caregivers and staff and volunteers is essential not only to mitigate  
8  
9 against the impact of a similar lockdown situation in the future but also to help  
10  
11 address both social inclusion and digital exclusion in usual times.  
12  
13

14  
15  
16  
17 Moving forward, a blended approach using remote and face-to-face methods to  
18  
19 enable social connections means person-centred support could be optimized and  
20  
21 could be used in rural areas to address social isolation. It would enable flexibility and  
22  
23 consistency with support and connectivity, should there be future lockdowns.  
24  
25

26  
27  
28 The response of Community Makers to the pandemic has shown the value of  
29  
30 technology for connecting people previously not used to the online world. Hopefully,  
31  
32 the legacy of this project will continue beyond the pandemic to help address social  
33  
34 isolation for people living with dementia and carers.  
35  
36

37  
38 Future work is planned to focus on developing the RRR into a full realist review and  
39  
40 evaluation. The aim is to better understand how and why community groups are/are  
41  
42 not using technology to support people affected by dementia; what technology they  
43  
44 are using and why and how this works alongside other types of support.  
45  
46  
47  
48  
49  
50

51 **Conflict of interest declaration:** The authors declare no conflict of interest. The  
52  
53 project is unfunded and reports on the work undertaken to inform the development of  
54  
55 the Community Makers online toolkit.  
56  
57

**Table 1. Contexts triggering mechanisms to produce certain outcomes, grouped as themes**

Theme	Context-Mechanism-Outcome configuration (stated as If C, then O, because M)
<p>To do with finding and fostering motivation and <b>purpose</b> for using technology</p>	<p>If a person's individual needs and preferences are taken into account (C), then they are more likely to use technology and benefit and/or enjoy using it (O) because they will have a clearer motivation and purpose for doing so (M). (Riikonen, 2013).</p> <p>If there is a goodness of fit between preference, abilities and activities in using technology (C), this fosters positive engagement that leads to a sense of satisfaction (O) because individuals' psychological needs are met (M). (Sweeney et al., 2021)</p> <p>If people are not involved at all stages of the development of technology (C), this will lead to people not using it (O) because they will feel it is not fit for purpose and does not meet their needs (M). (Rai, 2020)</p> <p>If technology is used to enhance a face-to-face activity, such as the use of multi-media for reminiscence (C), this can improve health, well-being and enjoyment (O) because it enables people to better engage with the past as well as the present and it enables spontaneity and flexibility (M). (Goodall et al., 2020)</p> <p>If technology is used because it is available rather than because it meets individual need or circumstances (such as face-to-face contact being restricted) (C), then people may not use it and/or not benefit from it (O) because they do not find it meets their needs or see the purpose of it (M). (Evans, 2021)</p>
<p>To do with the flexibility, usability and appropriateness of the <b>technology</b></p>	<p>If people can be involved in all stages of conception, identification of need and design of technology (C), then products will be attuned to meet the actual needs of people (O) because it will be easier to and more attractive for people to use them (M). (Meiland et al., 2017)</p> <p>If people and those providing support are aware of what technologies are available (C), then there is more likelihood that the person will have an enjoyable and beneficial experience (O) because there is more likelihood of identification of the right technology (M). (Meiland et al., 2017)</p>

Theme	Context-Mechanism-Outcome configuration (stated as If C, then O, because M)
	<p>If research methodologies into technology development and use of technology by people with dementia are improved (C), it will help the development of effective technologies (O) because replication of ineffective technologies will be avoided (M). (Meiland et al., 2017)</p> <p>If feedback from people on usability and acceptability of technology-based interventions is gathered (C), it can generate enjoyment and enthusiasm in participants (O) as they will feel involved in helping improve the quality of the intervention for the benefit of all (M). (Rai, 2020)</p> <p>If everyday technology can be used rather than technology specifically designed for people with dementia(C), then people will be more likely to use it and benefit (O) because they will feel it is part of normal life and not stigmatising or embarrassing as it draws attention to their condition (M). (Goodall et al., 2020)</p>
<p>To do with using technology for communication and social/community participation</p>	<p>If someone is living with dementia (C), they can benefit from information and communications technology (ICT) interventions (O) because they can help them to create and maintain social engagement and participation (M). (Pinto-Bruno, 2017)</p> <p>If people engage in ICT based interventions for social connectivity (C), this can promote more social behaviours (O) because people feel more comfortable in interacting and initiating conversations (M). (Pinto-Bruno, 2017)</p> <p>If technologies are used in a group setting (C), then devices feel easier to use (O) because difficulties are not viewed as abnormal or unexpected (M). (Sweeney et al., 2021)</p> <p>If access to online support and leisure activity is increased (C), then people will benefit from increased health and well-being (O) because they will be better able to maintain social networks and connections (M). (Masoud et al., 2021)</p> <p>If connectedness between participants (not just between facilitators and participants) is encouraged in online environments (C), then this can create a feeling of community (O) because there is a sense of belonging (M). (Masoud et al., 2021)</p>
